

Aggregation switches can support

Overview

They support link aggregation protocols such as Link Aggregation Control Protocol (LACP) and Static Link Aggregation, which allow multiple physical links to be combined into a single logical connection. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. All UniFi Switches support aggregation, except USW-Flex, USW-Flex-Mini and USW-Ultra. Port aggregation is not supported on most UniFi Gateways; it is only supported on the EFG, UXG Enterprise, UDM Pro, UDM SE and UDM Pro Max. The aggregation layer serves as the convergence point for multiple access layer switches and is responsible for handling all. An aggregate switch is a high-capacity network switch that consolidates connections from multiple access switches, acting as a central point for managing network traffic and providing enhanced bandwidth capabilities. It is essential for larger networks requiring efficient data flow. This article looks at what each such tool does, compares how they differ from each other, and offers suggestions as to what sort of network each.
