

Distribution Box Heat Dissipation Design

Overview

Energy-efficient distribution box designs 1 reduce power losses in large facilities primarily through optimized busbar sizing 2, proper material selection 3, effective heat management 4, smart monitoring systems 5, and strategic placement near load centers 6. The heat dissipation technology of the distribution box mainly includes the following methods. The first is natural cooling, through rational design of cooling fins and vents, using natural convection to discharge heat from the distribution box. The following are several common cooling methods for distribution boxes: Natural heat dissipation: Electrical equipment that distributes power has a heat loss due to the impedance and/or resistance of its conductors. 7-1 provides heat loss in. To determine the surface area of an enclosure in square feet, use the following equation: Surface Area = $2[(A \times B) + (A \times C) + (B \times C)] \div 144$ where the enclosure size is A x B x C in inches. The formula is simple: Heat = I^2R .
