

European heat dissipation bridges

Overview

The European standards "Thermal Bridges in building construction Heat flows and surface temperatures - Part 1: General calculation methods" (EN ISO 10211-1) pertaining to aspects of thermal performance of building constructions are already available since 1996. A third of EU Member States have no real 'good-practice' guidance on thermal bridges in the framework of their building energy regulations. It presents three different issues in connection with thermal bridges: National requirements and calculation procedures. The highways, railways and bridges that keep economies and communities thriving were not built to withstand rising temperatures. How can we stop them from melting down?

Roads are bending out of shape as temperatures rise.
