

How to design ports for core switches

Overview

Evaluate the required port types, speeds, and quantities based on your existing aggregation layer switch. If budget permits, opt for a core switch with diverse port types and a higher number of ports. RJ45 ports serve access-layer copper connections; SFP/SFP+ ports enable flexible 1G/10G uplinks; SFP28 delivers 25G for modern data centers; QSFP+ and QSFP28 support high-density 40G/100G spine-leaf. I am planning for a core switch requirement is it should connect 2000 access ports in the distribution / access layer and scale in future. For some options, I was thinking this: Option A no switchport no ip address Option B switchport switchport access switchport access vlan 105 or does this accomplish the same thing?
