

Load-bearing capacity of cable trays in computer room

Overview

Cable tray load capacity refers to the maximum amount of weight a tray system can safely support across a specified span distance without permanent deformation or structural failure. Load ratings are typically measured in kilograms per meter or pounds per foot. The standard requires that load-bearing tests be conducted with a UDL, meaning the load. Using our advanced cable tray load calculator is simple and ensures your electrical installation meets structural and safety standards. It will carry: Cable Weights (always check maker's data!): Let's do the sums: Result: The cables alone add 2850 lbs to this 100-foot tray section. Don't forget the weight of any lids or dividers.
