

# Network Rack Bracket Installation Method

## AI Overview

Installing network rack brackets involves selecting the correct brackets, aligning them with your rack, and securing them with appropriate screws and cage nuts while following safety precautions.

**Step 1: Prepare Your Rack and Equipment** Before installation, ensure your rack is stable and has sufficient space for the equipment. Decide whether you are using a two-post or four-post rack: two-post racks are suitable for lighter devices, while four-post racks provide extra support for heavier servers and switches. Verify the rack's hole type (square or round) to select compatible brackets and screws.

**Step 2: Select the Correct Brackets** Most servers and network devices come with front and rear mounting brackets. Choose the brackets that match your rack's hole type. For square-hole racks, use one M6 screw per side; for threaded round-hole racks, use three M6 or 10-32 screws per side. Ensure the brackets are oriented correctly, usually with an arrow pointing upward.

**Step 3: Install Cage Nuts (if needed)** For racks with round holes, insert cage nuts into the designated holes for the rear mounting brackets. If you are installing shipping brackets for transport, insert the cage nuts for these brackets in the first and third holes above the mounting bracket nuts.

**Step 4: Attach the Brackets**  
**Front Brackets:** Align the brackets with the rack holes and secure them using the selected screws.  
**Rear Brackets:** For square-hole racks, attach directly; for round-hole racks, use the cage nuts to secure the screws.

**Step 5: Safety and Weight Considerations** Always load equipment from the bottom up to prevent the rack from tipping. Use a mechanical lift for heavy servers, or remove components to reduce weight. Deploy the rack's anti-tilt bar to enhance stability during installation.

**Step 6: Final Checks** Ensure all screws are tight and brackets are secure. Verify that the equipment is level and properly supported.
