

Optical module port lit but no data transmission

Overview

Use an optical power meter to check whether the transmit optical power of the optical module is normal. First, the transmission class of the optical module fault investigation and solution method This type of optical module failure mainly includes port not UP, port status is UP but do not receive or send messages, port frequently up or down and CRC error. Specific troubleshooting methods and. In data centers and fiber optic communication networks, the optical links between switches serve as the core channels for data transmission, and their stable connectivity directly determines the operational efficiency and reliability of the entire network. However, during installation and daily operation, various issues may arise. The device management or driver software has a bug.
