

Optical module reception and emission parameters

Overview

The core technical parameters of optical modules include: transmission rate, encapsulation, transmit optical power, receive sensitivity, transmission distance, center wavelength, optical interface type, operating temperature, maximum power consumption, etc. Let's. An optical module usually consists of an optical transmitting device (TOSA, including a laser), an optical receiving device (ROSA, including a photodetector), functional circuits, main control circuit board (PCBA), housing and optical (electrical) interface and other components. This article will introduce the performance parameters of the optical module, including optical. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process. Let's take a look below! Optical module parameters Center wavelength: the unit of center wavelength is nanometer (nm), currently.
