

Parallel distribution box for one circuit

Overview

That solution is a parallel feeder distribution system. Instead, this setup intelligently splits the power, giving you a stable and reliable parallel service without compromising on. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. The control box can not be disposed of together with the household waste. Combining up to 24 separately protected, ready-made circuits in an output distribution unit built into a parallel switch panel, the PDB. Grid port connection of grid distribution box side should be analyzed and operated depending on Here will not be described into details.
