

The router's fiber optic light is red but it's still usable

AI Overview

A red fiber optic light on your router indicates a loss of signal, meaning your router cannot communicate with your Internet Service Provider (ISP). Common Causes

Fiber Optic Cable Damage: Physical cuts, bends, or kinks in the fiber optic cable can disrupt the signal and trigger a red light on the router.

Service Outage: ISP maintenance, technical issues, or local outages can prevent your router from connecting to the internet.

Loose or Improper Connections: Cables not fully seated in the WAN/ONT port or connected to the wrong port can cause a red light.

Faulty Router or ONT: Malfunctioning hardware may fail to establish a connection even if the cables and service are fine.

Power Issues: Unstable power supply or faulty surge protectors can interfere with the router's operation.

Troubleshooting Steps

Check for ISP Outages: Visit your ISP's website or social media pages to see if there is a known service disruption.

Inspect the Fiber Optic Cable: Look for visible damage and ensure the cable is properly connected to the correct port. Avoid sharp bends or pinches.

Reconnect Cables: Unplug and firmly reconnect the fiber optic cable to the WAN/ONT port. Ensure it clicks into place.

Power Cycle the Router: Turn off the router, wait 30 seconds, and turn it back on. This clears temporary settings and can restore connectivity.

Test Power Supply: Plug the router directly into a wall outlet if using a surge protector, and check if the red light persists.

Contact Your ISP: If the red light remains after checking cables and power, your ISP may need to test the line or replace faulty equipment.

By systematically checking these factors, you can often identify whether the issue is with your equipment, the fiber optic cable, or the ISP service, and take appropriate action to restore your internet connection.
