

Thickness Acceptance Standard for Distribution Boxes

AI Overview

The standard thickness for distribution boxes generally ranges from 1.2mm to 2.0mm, depending on type, size, material, and intended use. National Standards and General Guidelines According to national regulations, low-voltage distribution boxes should have a wall thickness of at least 1.5mm, while metal auxiliary poles should be at least 1.2mm thick to ensure safety, structural integrity, and earthquake resistance. Indoor distribution boxes typically require a thickness between 1.2mm and 2.0mm, depending on their size and load requirements. Factors Affecting Thickness

Selection Type and Purpose of the Box: Lighting distribution boxes: For smaller loads, 1.5mm is sufficient for boxes under 600mm, while 2.0mm is recommended for larger boxes. Power distribution boxes: These handle higher currents and mechanical stresses, requiring a minimum of 1.5mm, with larger or high-capacity boxes often using 2.0mm or more.

Box Material: Steel, stainless steel, and aluminum require thicker walls than plastic or iron boxes to maintain strength and durability.

Size and Weight: Boxes wider than 500mm should have at least 1.2mm thickness, and those 800mm or larger should be at least 1.5mm. Semi-perimeter measurements also influence thickness, with ≥ 900 mm requiring 1.5mm.

Seismic and Environmental Considerations: Boxes must withstand earthquakes and temperature variations, which may necessitate thicker walls for stability.

Outdoor and Specialized Boxes: Outdoor distribution cabinets, such as those for substations, are often fabricated from 2mm galvanized steel to provide reinforcement, weather protection, and compliance with IP-55 standards. Roof design, locking mechanisms, and earthing points are also considered in thickness and structural design.

Summary: When selecting a distribution box, thickness should be chosen based on load, size, materi...
