

With core switch

Overview

A core switch is the primary switch installed at the backbone of a layered or hierarchical network. This white paper introduces the following three types of network switches and further discusses the selection criteria for each switch. Sitting at the top of the hierarchical model, core switches interconnect distribution layer switches and provide high-speed data transfer across. In the realm of system networking, three key types of switches are frequently mentioned: access switches, aggregation switches, and core switches. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing.
